

Automated wiping process
for greater production efficiency

Would you like to efficiently manufacture high-quality yarns? And simultaneously optimize the performance of your plant, minimize costs and maximize profits?

Then our wiping robot is the perfect solution for you: it will clean your spin packs – ensuring excellent, consistent wiping quality. Automating the wiping process increases the full package rate, lowers the yarn break rate and increases the efficiency of your manufacturing facilities.

The benefits at a glance:

- Higher full package rate
- Lower yarn break rate
- Up to 25 % longer wiping intervals;
- Less waste
- Utilization of silicon oil from canisters (drums); this dispenses with approx. 95 % of the spray cans normally used in manual wiping
- Relative independence from the availability of your staff
- HSE-friendly working environment for your employees

The wiping robot can be retrofitted to numerous spinning plants. Interested? Then simply contact us sending an e-mail to servicesales.barmag@oerlikon.com.
